

# SAIKAT BISHAL *Software Developer*

Github | Blogs | saikatbishal.com | LinkedIn | Twitter | saikat.bishal786@gmail.com | +91 9064217900

## PROFILE

Senior Frontend Engineer (5+ yrs) building conversational AI interfaces and design token systems in React/TypeScript. Cut QA review effort 90% at Rifa.ai . shipped a 25+ component library.

## WORK EXPERIENCE

**Rifa.ai, Senior Software Engineer** January 2026 – Present | Remote

- **Conversational AI Interfaces:** Building the Voice and Chat Interaction surfaces of the agent dashboard in React/TypeScript. Timestamped transcripts with speaker attribution, call event timelines, and Summary/Debug Log panels.
- **AI & Deterministic Auditing:** Shipping auditing views for AI calls and chats that cut the QA team's manual review effort by 90%.
- **Component Library & Design Tokens:** Building a 25+ component library end-to-end and migrating the dashboard onto a single source-of-truth Figma token layer (colours, typography, spacing, shadows) via Tailwind config and CSS variables, eliminating style drift across the monorepo.
- **CRM Platform UI:** Shipping core CRM surfaces — history-stack breadcrumb navigation and a redesigned deal pipeline table with risk indicators, inline call status, and icon-first actions.
- **API Design & Architecture:** Authoring REST API specifications for backend teams and drove proposals on cross-boundary problems, including moving transcript utterance merging for speaker-overlap cases to a backend semantic-grouping service.
- **Design-to-Code Tooling:** Established a Figma MCP-based workflow with reusable agent skill files, standardising AI-assisted refactors across the frontend monorepo.

**Ramco Systems, Software Developer** February 2024 – September 2025 | Chennai, India

- **Design System Architecture:** Owned and scaled an org-wide React/Next.js design system, creating modular components with **Storybook** that reduced UI development cycles by **40%**.
- **Web Performance:** Spearheaded performance initiatives to improve **Core Web Vitals**, implementing route-based code splitting, tree-shaking, and image optimization, resulting in a **30% reduction** in initial bundle size.
- **DevOps & Security:** Established a frontend CI/CD pipeline using **Vite** and TypeScript. Enforced **Web Security** standards by integrating secure headers and rigorous linting for XSS vulnerabilities.
- **Analytics Integration:** Collaborated with backend teams to instrument product analytics (proxy for Google Analytics), enabling data-driven decision-making for user journey optimization.

**Rezolve.ai, Frontend Developer** June 2023 – November 2023 | Bengaluru, India

- **Complex UI Engineering:** Shipped a large-scale React console managing complex configuration journeys (Formik-style logic), optimizing heavy rendering tasks using **virtualization** to maintain **60 FPS**.
- **Secure Authentication:** Integrated **Keycloak** (OAuth/JWT) for secure user authentication and Role-Based Access Control (RBAC), ensuring strict adherence to **Web Security** protocols.
- **Migration & Tooling:** Contributed to migrating legacy workflows to a **Vite-based architecture**, significantly improving local development speed and build performance.
- **Code Quality:** Enforced high test coverage using **Jest** and TypeScript strict mode, reducing production bug leakage.

**LTIMindtree, Software Engineer** July 2021 – May 2023 | Bengaluru, India

- **Responsive UI Development:** Developed cross-browser compatible interfaces using semantic HTML and accessible (WCAG/ARIA) patterns, ensuring inclusivity across devices.
- **Component Libraries:** Contributed to the standardization of internal UI component APIs, improving consistency across multiple client deliverables.
- **Analytics & CI/CD:** Partnered with data engineering to implement analytics tracking and set up initial automated testing pipelines.

## EDUCATION

**B.Tech (NIT Jsr.), National Institute of Technology, Jamshedpur** 2017 – 2021 | Jamshedpur, India

## SKILLS

| Web Performance & Security                                                                                                                                            | Backend Technologies                                                                                                            | Frontend Technologies                                                                                               | AI-Assisted Engineering & Design Tooling                                                                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Core Web Vitals (LCP/CLS), Bundle Analysis, Lazy Loading, Memoization, Virtualization, OAuth 2.0, JWT, XSS/CSRF Prevention, OWASP Security Practices, Secure Headers. | Node.js, Express.js, NestJS, RESTful API & GraphQL API development, Authentication/Authorization (Keycloak, Kratos, OAuth, JWT) | React.js, Next.js, Redux, Redux Toolkit, Redux-Saga, TypeScript, JavaScript ES6+, UI Component Libraries, Storybook | Conversational/Voice AI interfaces, design token pipelines (Figma → Tailwind/CSS variables), Figma Dev Mode & MCP servers, Anthropic API integration, Claude Code agent skills, prompt design for code agents. |

## PERSONAL PROJECTS

**Platform: Indian Railways Journey Map**  September 2026 – Present

- Built a mobile-first PWA that records my train journeys across India on a hand-drawn SVG/Canvas map, with no map library.
- Routed each journey through a rail-network graph of 8,696 stations that I built myself, so lines follow the actual track instead of crossing the sea. This also fixed a ~10% undercount in total distance.
- Kept pan and zoom at 60 fps with ref-based transforms, Canvas rendering, zoom-based level of detail and label-collision handling, all on a light/dark design-token system.

**React Performance Dashboard (npm Package)**  @saikat786/react-perf-dashboard

- **Overview:** Architected and published a lightweight (<2KB), zero-dependency performance monitoring library for React applications.

- **Technical Implementation:** Engineered a decoupled rendering loop using `requestAnimationFrame` to track **FPS** without blocking the main JavaScript thread.
- **Advanced Observability:** Implemented low-level interception by monkey-patching the `window.fetch` prototype to visualize **Network Latency** and API status codes in real-time.
- **Impact:** Provides developers with drop-in observability for **Memory Usage** (Heap Size) and rendering performance, decoupled from the React lifecycle.
